

ENVIRONMENTAL OIL BOOM SEPARATORS AND GUIDES

The Maritime International environmental oil boom separator maintains standoff between oil booms and ships. The lightweight foam core construction and polyurethane skin reduce maintenance costs and make cleaning easy. All stainless steel attachments and hardware further prolong the life of the separator.

The polyurethane and thermoplastic design of Maritime International's patented oil boom guide reduces maintenance expense. The guide maintains the oil boom position on open piers and can easily be designed to accommodate any tidal or wave variation. The oil boom guide is easy to install and can deflect and recover if inadvertently compressed. Available in various colors. The Maritime oil boom guide can be provided with stainless steel or kevlar pile straps depending on location and pile type.
