

# MPCS

## Type I, II & III - Paint Camel

The one, two and three tier Maritime Paint Camel Systems are paint floats which allow hull painting and preservation to be completed at various elevations. The body of the MPCS is constructed of tubular steel that is foam filled for extended service life. Non-marking grey rubber fenders prevent damage to the camel and adjacent ships. The composite non-skid decking is sealed to prevent contaminants from leaking into surrounding waters. A paint containment drip tray encompasses the entire perimeter of the camel to prevent contamination of surrounding waters. The paint storage and supply locker contains all necessities of a paint locker and an optional adjustable overhead cover can provide shelter to workers if required.
