## Universal Triangular & Cylindrical Submarine Separators

The universal triangular submarine separator and cylindrical submarine separator both incorporate composite floats with thermoplastic markings for longevity and exact detail. Kevlar straps replace steel chain to prolong the separator lifespan. The tubular steel components of the Maritime triangular separators are completely filled with closed cell foam for buoyancy retention if the body was compromised. The steel frames can be coated with a thermal arc sprayed aluminum or anti-fouling paint system for maintenance cost reduction. Stainless steel tie down lugs preserve the separator's coating system and non-marking grey vibration pads under the steel frame protect the paint system of the separator and ship alike. The separators can be sold in a variety of sets to allow nesting of submarines for tender or in port operations.
